

ALLTRAILS “JOURNEYS”: CURATED HIKING ITINERARIES

Product Requirement Document

Digital Product in Focus : **Alltrails Mobile App (iOS)**

Overview:

As an avid hiker, I have been using the Alltrails iOS app for several years and it has become one of my favorite apps to use. Over the years the application has improved its functionality and UX/UI features significantly, securing itself as one of the top outdoor platform for the casual/professional hikers. This PRD highlights a common user problem and offers a feasible medium lift solution that will not only enhance the application’s usability but also bring in new users of all ages and expertise.

User Problem:

As a user of the app myself, I was often frustrated with some of the user experience and wondered if other people felt the same. After doing some user research on reddit, youtube, and from people I have met in my hiking trips. I have identified these key problems users are facing.

- **Planning fatigue** : There are lots of users out there who likes to plan a whole day of multiple hikes and other activities. However, those users constantly have to jump between AllTrails, GoogleMaps and other third party blogs to curate their hiking journey. There is no way for them to plan multiple hikes, get driving direction from one hike to another and also get suggestive amenities/rest periods/warnings.
- **The Paywall issue** : Users (including myself) often hit a paywall when they are already frustrated due to no signal, inclement weather, unable to access offline maps and share location with their friends. All these extra features are available on their premium AllTrails+ subscription. However, at that point it becomes a “grudge” purchase rather than a natural proactive purchase one for AllTrails+.

Solution:

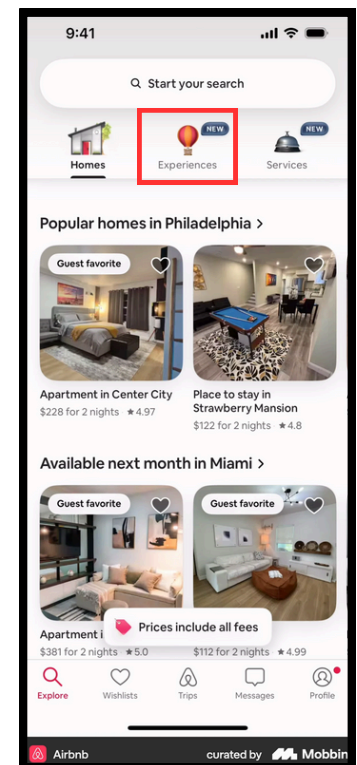

The solution for this specific problem comes from my personal interaction with the AirBnB application. They have a tab at the top called “Experiences”, highlighted in red on the right, which essentially handles the user’s timeline by handling end to end logistics of a trip to a new country or city.

This same logic can be applied for AllTrails where the app can curate “experiences” by selecting multiple hikes that are similar in length and close proximity from one another, get driving instructions from one hike to the other and get other suggestive information such as nearby amenities and rest periods. This call to action (CTA) will be called “**Journeys**”. The details for this CTA are given below.

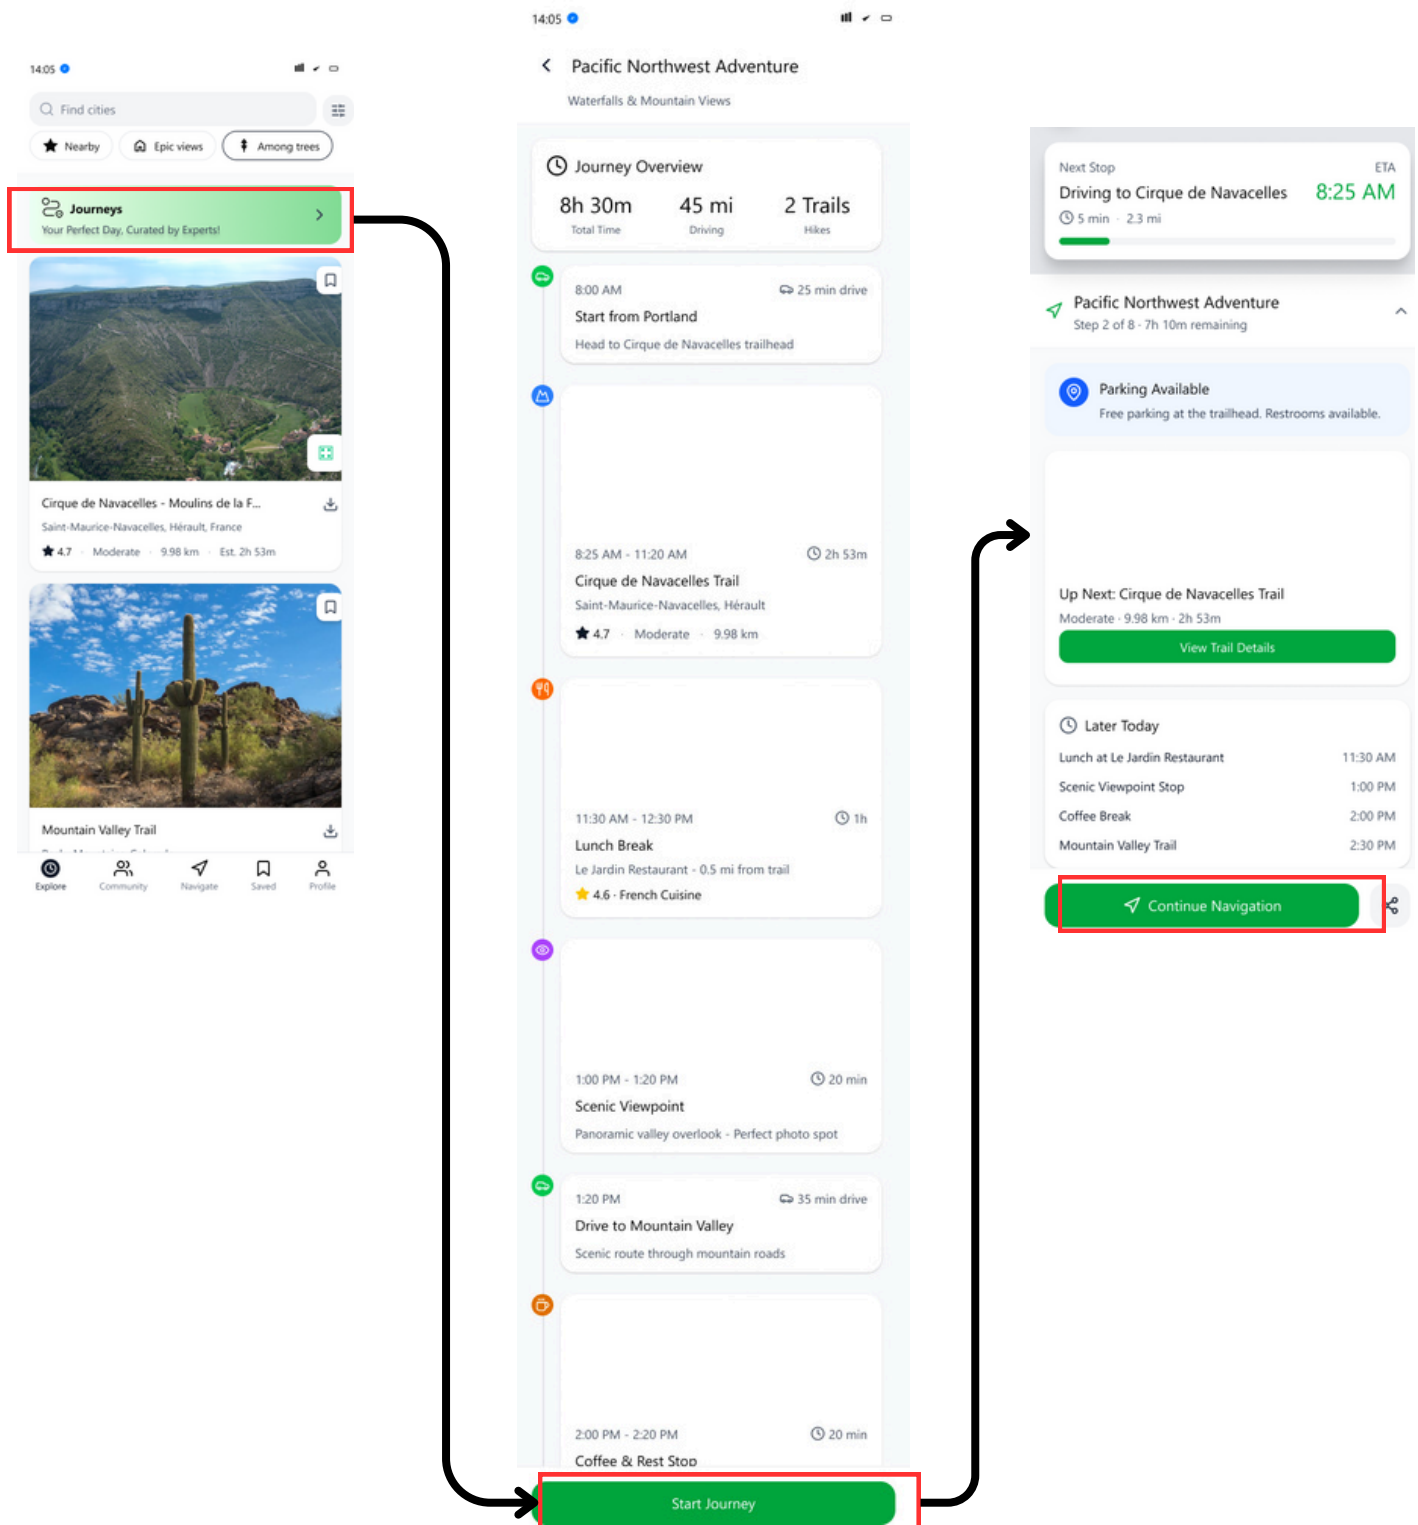

User Base : This feature will be targeting a high value user segment who can be categorized as the ‘The Active Traveler’. This group comprises of people who are traveling to National Parks, outdoor hubs, mountains and have a limited time to plan the perfect trip. They are currently frustrated “app-hopping” and would appreciate if everything can be done seamlessly in one app.

Technological Lift : This would be considered as a Medium Lift on the Jira Board since we will be creating new data points, integration maps APIs, and building a new logic layer on the existing app.

Business Alignment : This feature can be used to solve the paywall frustration issue that users often face. Journeys will incentivize the user to naturally purchase AllTrails+ during their planning phase because it will unlock offline journey download and other safety features that are already part of AllTrails+ and will make their trip even more perfect.

Figma Prototype:

New "Journey" CTA flow

Note : This is just a prototype of how the new CTA flow will look like. AllTrails design files aren't public

Minimum Viable Product

We know through user research that there is a demand for something like this, however we still need validate this feature through A/B testing. So, we need to flush out what is the minimum viable product, which is a basic version of the feature that meets the minimum requirements for usage.

MVP Scope:

- Since data for curated journeys are currently scattered and there is no APIs that we can directly use to gather data, the first 100-200 journey entries will be admin curated for popular hiking spots and national parks.
- A vertical timeline view that will stack multiple trails in order with breaks or other amenities in between.
- Transit directions from one trail to another would require the usage of Google Maps APIs.
- A summary header showing Total Mileage, Total Elevation Gain, and Estimated Total Duration.

Success Metrics:

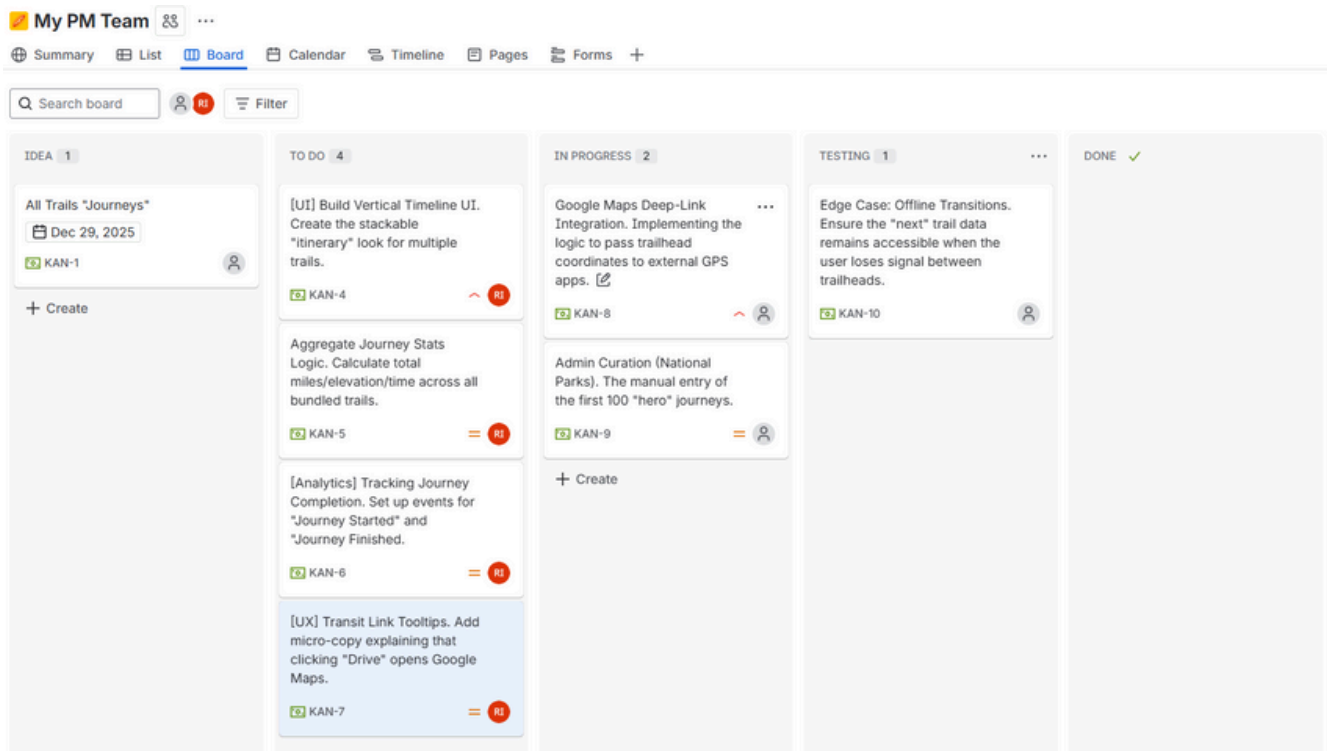

Primary KPIs to track.

- Click rate of the new “Journey” button/CTA.
- Time spent on the “Journey” Flow. Lower the better.
- Daily Active User count after the launch of the feature.
- Monthly Active User count after the launch of the feature.
- Journey complete rate. How many users started and ended the entire flow of the “Journey”?

Its important to track and analyze these metrics to determine the Product Market Fit, only then we can move on monetization of the “Journey” feature.

Jira Board:

A quick demonstration of what a hypothetical Jira Board will look like for this feature launch.

Some story points will require a more heavier lift than others, and it highly depends on the capabilities of the engineering and UX teams.

Overall, the MVP CTA can be done in approximately 4-5 sprints. Our A/B testing results on that feature will determine what the next steps should be. To fully flush out this feature, it will take a much longer time due to possibility of integration issues and other unforeseen bugs.

Acceptance criteria for each story point not shared in the board.

User persona: Tyler

This section outlines the user experience of “Journeys”.

Age : 28

Name : Tyler

Location : Seattle, WA

- 1) Tyler, a weekend warrior, only has 2 days to hike near Zion National Park and he is planning something last minute. He doesn't want to spend time on reddit, YouTube and other social platform to plan the perfect trip.
- 2) He goes to AllTrails App and clicks on Journeys. Immediately he is faced with curated experiences around his area. He changes the location to Zion National Park and filters for a 2 day trip.
- 3) The Journey feature curates a 2 day trip for him including, hikes, resting spots, lunch suggestions, travel distances and suggested time spent on each activity.
- 4) He closes the app and goes about his day, but he realizes he might need to download the journey offline just in case of an emergency. Due to ease of the experience itself, he purchases the AllTrails+ premium for a month because he realizes the value it brings and the time it saves to keep his weekend spirit going strong. If everything goes well, he might even consider being a regular member.
